CPU Model 1/	Millions of Instruction Per Second (MIPS)	Conversion	Conversion Factor
Hitachi Pilot Series 59S	749	26.0/749.0	.0347129

- (1) Bidder machine models. If you are bidding on a system not listed in Cheryl Watson's CPU Chart, please provide the source, a copy of the source document, and a conversion factor based on the IBM 3090-600S.
- (2) The System Resource Manager (SRM) constant (AKA service units per second) value is provided by the vendor (i.e. IBM) and used by the SRM to determine the frequency of internal functions, such as swap analysis, or period transition. The "SRM constant" is used to make OS/390 installation specifications transparent across the IBM compatible processor range. This SRM constant is also used to derive a conversion factor for different processor machines.
- (3) This is the calculated conversion factor for normalizing to a base machine. The base machine is an IBM 3090-600S. The SRM constant of the bidder machine is divided by the SRM constant of the 3090-600S to obtain the conversion factor. This is how we determine the processing power difference of the individual central processor units in each machine.
